Calendar year performance

Risk classification

A fund's volatility is determined using a statistical measure called "standard deviation." Standard deviation is a statistical measure of how much a return varies over an extended period of time. The more variable the returns, the larger the standard deviation. Investors may examine historical standard deviation in conjunction with historical returns to decide whether an investment's volatility would have been acceptable given the returns it would have produced. A higher standard deviation indicates a wider dispersion of past returns and thus greater historical volatility. Standard deviation does not indicate how an investment actually performed, but it does indicate the volatility of its returns over time. Standard deviation is annualized. The returns used for this calculation are not load-adjusted. Standard deviation does not predict the future volatility of a fund.

The investment risk level indicated is required to be determined in accordance with the Canadian Securities Administrators standardized risk classification methodology, which is based on the historical volatility of a fund, as measured by the ten-year annualized standard deviation of the returns of the fund. Standard deviation is used to quantify the historical dispersion of returns around the average returns over a recent ten-year period.

QUARTERLY TOP TEN HOLDINGS

AS AT MARCH 31, 2025

Apple – Information Technology	
Microsoft – Information Technology	
Nvidia – Information Technology

Aggregate assets (all series)

\$21.2 million
(as at April 30, 2025)

Management expense ratio – Series B

2.07%, as at December 31, 2024

¹ The compound growth calculations shown are used to illustrate the effects of the compound growth rate and is not intended to reflect future values of the fund or returns on investment in any fund. ² Month-end asset mixes may total greater than/less than 100% due to differences in the timing of cashflows and investments, and/or to reflect cash held for the purposes of collateral allocations associated with certain types of derivatives. Country and sector allocations show specific exposures to countries/sectors representing at least 1% of total fund asset. As such, the values displayed may not total 100%. ³ Fidelity SmartHedge U.S. Equity Fund uses derivatives to implement a disciplined options-based strategy designed to provide downside risk mitigation. The strategy used by the Fund, while designed to offset or mitigate a decrease in the value of the Fund's investments, does not completely eliminate downside risk. Using an options-based strategy carries no guarantees, and options can expire worthless, meaning that the Fund can lose the entire amount of the premiums that are paid to purchase those options.
