### Fidelity Global Growth Private Pool

- A core solution designed for investors seeking equity and fixed income exposure.
- The Pool will invest in global markets, providing Canadian investors with the benefit of investing in different countries and industries.
- The Pool offers a multi-asset approach, combining asset classes that historically have exhibited low correlation to one another, which can help reduce volatility.
- Employs active asset allocation across multiple dimensions of the portfolio to take advantage of market opportunities and manage risk.

### Pool management

- Portfolio managers are David Wolf and David Tulk.

- 1 Management fees do not include administration and other operating expenses and applicable sales tax. Fees are shown in basis points. Note that fee reductions are applicable only on that portion of assets that fall within the specified tier.
- 2 The blended benchmark is 65.0% MSCI All Country World ex-Canada Index, 20.0% S&P/TSX Capped Composite Index and 15.0% FTSE Canada Universe Bond Index.
- 3 A fund's volatility is determined using a statistical measure called "standard deviation. Standard deviation is a statistical measure of how much a return varies over an extended period of time. The more variable the returns, the larger the standard deviation. Investors may examine historical standard deviation in conjunction with historical returns to decide whether an investment's volatility would have been acceptable given the returns it would have produced. A higher standard deviation indicates a wider dispersion of past returns and thus greater historical volatility. Standard deviation does not indicate how an investment actually performed, but it does indicate the volatility of its returns over time. Standard deviation is annualized. The returns used for this calculation are not load-adjusted. Standard deviation does not predict the future volatility of a fund. The investment risk level indicated is required to be determined in accordance with the Canadian Securities Administrators standardized risk classification methodology, which is based on the historical volatility of a fund, as measured by the ten-year annualized standard deviation of the returns of the fund. Standard deviation is used to quantify the historical dispersion of returns around the average returns over a recent ten-year period.

Commissions, trailing commissions, management fees and expenses all may be associated with mutual fund investments. Please read the prospectus, which contains detailed investment information, before investing. The indicated rates of return are historical annual compounded total returns for the period indicated including changes in unit value and reinvestment of distributions. The indicated rates of return do not take into account sales, redemption, distribution or option charges or income taxes payable by any unitholder that would have reduced returns. Mutual funds are not guaranteed. Their values change frequently. Past performance may not be repeated. © 2025 Fidelity Investments Canada ULC. All rights reserved.
